1. Given the three numbers A, B, C. Write an algorithm to compute and print out the sum, the average, and the product of these values.

```
Start
Let A = 0, B = 0, C = 0, sum=0, ave = 0, product=0
input sum= A+B+C
input ave= (A+B+C)/3
input product=A*B*C
Print sum
Print ave
Print product
End
```

2. Write an algorithm that will ask the user to get final grades. Evaluate the final grade, if the final grade is greater than75, indicate the remarks are “Passed”, if not the remarks are “Failed”.

```
Start
let FinalGrd="0"
if FinalGrd=>75
print=“Passed”
else
print="failed"
End
```

3. Given the value of the password is “JRU”, write an algorithm that if the user input the correct password, it will display “Password is Accepted” if not “Password is Incorrect

```
Start
Let password="JRU"
input password
if password=="JRU"
print="Password is Accepted"
else
print=“Password is Incorrect”
End
```

4. Write an algorithm that would display numbers from 1-5.

```
Start
Let number="1"
Print number
If number <5
Add to number
Go back to line 3
Else number==5
End
```
